

10kV busbar completely shut down

Overview

When a busbar fault occurs, the BBP will trip all circuits connected to the busbar, shutting down the entire substation. However, this high-speed clearing must be balanced against the need for security. Tripping incorrectly for an external fault may cause large outages, and jeopardize power system. Busbar protection (BBP): Protection intended to detect and operate to clear faults on a busbar. ment has been carefully checked by ABB but deviations cannot be completely ruled out. Other than under explicit contractual commitments, in no event shall ABB be responsible or liable for any los equipment. In our power plant 10kv busbar pt feeder has interlock with incoming cb of busbar. is it necessary?

Conversely, if the substation has only one protected zone, the BBP operation will shut down the entire substation.
