

## Air compressor station distribution box

### Overview

Air distribution blocks split a single compressed air supply line into multiple outlets, allowing you to feed several pneumatic tools, machines or work stations from one main line without running individual pipes back to the compressor. The compressed air distribution system is every pipe, valve, fitting, and hose between the compressor room and the tools at the end of the line. Get it right and every station runs at full working pressure. We have a reputation for providing. Compressed air storage, distribution and pressure maintenance systems are key components of any compressed air station. An efficient compressed air system needs to include a well-designed pipe network in order to minimise the loss of air pressure from the distribution network.
