

Are fiber optic sensors resistant to low temperatures

Overview

Fused-silica fibers offer the lowest losses and can sustain temperatures up to 800°C in principle, but are often limited to lower temperatures because of a protective polymer coating on top of the cladding. Strain is limited to 1% or 10000 before the probability of a fiber damage. Fiber optic temperature sensors offer superior performance compared to these techniques, thanks to their numerous benefits. This makes them suitable for use in space applications and hazardous environments such as high-voltage machinery (e., generators, motors, transformers), nuclear power. Optical fiber's ability to withstand extreme heat and cold directly impacts signal integrity, network reliability, and maintenance costs, especially in harsh environments like industrial facilities, outdoor installations, and data centers. Fiber-Bragg-Gratings (FBGs) are used for spot sensing, whereas Rayleigh, Brillouin and Raman scattering are used for distributed sensing in long fibers. We'll delve into the groundbreaking capabilities of Sensuron's Fiber Optic Sensing Systems (FOSS), showcasing their unique advantages over conventional sensors.
