

DC power supply mode requires the use of a hybrid optical-electric cable

Overview

A hybrid cable combines two transmission media: Optical fibers for data, typically single-mode or multimode. Copper power conductors, usually low-voltage DC to supply the kind of device used in remote radios or IP cameras. This document provides detailed recommendations for optical/metallic hybrid cables used in communication systems, addressing their construction, characteristics, and applications. It categorizes hybrid cables into three types based on their functionality: Type I (communication only), Type II (power. CommScope has developed a solution that combines power and optical fiber communications into one system, eliminating the hassles and extra expense associated with powering typical low-power network devices. Uses commonly available flat cable installation hardware. On campus networks, hybrid cables are typically used to connect access switches and WLAN APs, so that the access switches can supply PoE power to the APs. DuetConnect Hybrid Copper-Fiber Cables allow one cable to offer the advantages of DC power and fiber, safely delivering both over long distances to remote locations where standard power is unavailable or too costly to install. (hereinafter referred to as "full digital control") has been put into practical use more than twenty years ago, but it has not become popular except in the fields of "switching.
