

## Do fiber optic splicing use a frame

### Overview

This fiber optic splicing technique involves the precise alignment of two fiber optic cables, held in place by a self-contained assembly rather than a permanent bond. Fiber optic cable splicing involves joining two fiber optic cables together. Another method of connecting optical fibers is termination or connectorization, which consists of processing the end of a fiber optic bundle so that it can be connected to other fibers or devices through fiber optic. In this guide, we cover the basics of fiber optic splicing, how to perform splicing using two different methods, and finally some best practices to perform good fiber splicing. This technique ensures high-performance data transmission and is essential in extending cable runs, repairing broken links, or establishing new network paths in data. A fiber optic termination box, often called an optical distribution frame (ODF) or fiber patch panel, serves as the endpoint where incoming fibers connect to devices or patch cords. Termination is the other, more frequent way of linking fibers.
