

Function and Application of Optical Point Conversion Module

Overview

Optical modules are compact devices that convert electrical signals into optical signals and vice versa. They are used in fiber optic communication systems to transmit data over long distances with minimal loss and interference. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. At present, the world's AI large-scale models have been released one after another and combined with industry applications to promote the smart upgrade of thousands of industries, and continue to drive the demand for optical chips, optical devices, and optical module in the upstream of the data. Optical modules (also known as fiber optic transceivers) are essential components in modern communication networks, enabling high-speed data transmission by converting electrical signals into optical signals and vice versa. These compact yet powerful devices serve as the bridge between electrical. Optical module, also known as Optical Module in English, is the "heart" of the optical fiber communication system.
