

How far should a fiber optic router be placed

Overview

Routers should be at least 1-1.5 feet off the floor, preferably on a small table. You can also purchase a wall mount for your router as well. One exception to this rule is people with multistory homes. Wi-Fi uses frequencies that behave similarly to light: they reflect, scatter, and get absorbed by objects. The best place to put your router is at a reasonable distance (around 5 feet) from other electronics, which will ensure a better Wi-Fi strength for everyone in the household. Keeping your router in a cupboard or a spare room will give you a poorer signal, so try to make sure it's out in an open. Put your wireless router at a certain height. It is better to place the wireless router on a table or shelf and keep it at a certain height so that the omnidirectional antenna's transmitting ability can be utilized. Another benefit to putting your router in the middle of your home is that it will improve your network security.
