

How to measure the temperature of a high-voltage busbar

Overview

Non-contact infrared sensors continuously monitor busbar temperature from a safe distance within cabinets, avoiding physical contact or complex insulation requirements. They detect early signs of overheating, allowing preventive maintenance. Temperature monitoring in high-voltage busbar systems is vital for preventing faults, yet difficult due to electrical hazards, limited accessibility in switchgear cabinets, and interference risks in traditional contact-based methods. Due to busbars conducting high currents, small rises in temperature can be indicative of faults. Temperature rise testing is one of the recommendations of IEC 61439; our system for monitoring switchgear and busbars is easily integrated with new installations or retrofitted to existing infrastructure. Switchgear and busbars can be constantly and comprehensively monitored for temperature rises. Calex non-contact infrared temperature sensors, in conjunction with a centralised monitoring system, are an ideal way of measuring these temperatures.
