

In which year were electrical cables replaced by optical cables

Overview

The 1970's heralded XLPE insulations replacing paper insulated cables in medium voltage applications. In the 1980's optical fibres were being introduced in overhead lines for data transmission and condition monitoring, and further use of XLPE in high voltage transmission lines. Metallic conductor cable technology is perhaps one of the oldest fields of endeavor in electrical engineering, whose origins can be traced back approximately 150 years. This cable, carrying hope and ambition, enabled Queen Victoria's 317-word telegram to traverse the Atlantic. Electric cables were made obsolete by a new kind of optics: fiber optics. Now messages travel by light waves, not electrical impulses. And the core of today's cables is glass fiber, not copper wire. Late in the 20th century, the world's voracious appetite for communications forced a major change in.
