

Install lightning protection grounding on the distribution box

Overview

Attach a ground wire from one of the threaded studs (A) at the bottom of the housing, to the mounting plate (B). The ground resistance between all system parts shall be $<$. The need to electrically connect the grounding loop of lightning protection installed directly on the building with the grounding loop for electrical installations is described in the current regulatory documents (electrical installation code). We quote literally: "Grounding devices for protective. Our lightning and surge voltage protection systems are perfectly matched to one another and to the requirements in the different zones - from the air-termination device, which must arrest the full energy of a lightning strike, through to fine power protection, which eliminates the last voltage. Today, we're diving deep into the world of distribution box grounding, breaking down the standards, and shining a light on those sneaky mistakes that even experienced electricians sometimes make. This helps to reduce the potential difference that exists between conductive parts and the earth. Equipment Protection: Grounding protects substation. Power from factory ground must be installed by a qualified electrician. Each DISTRIBUTION BOX and controller must be grounded. 26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. During fault conditions, low impedance results in high fault current flow, causing overcurrent protective.
