

Key Concepts of the Energy Internet

Overview

Energy Internet: Concept and Architecture EI can be defined as a dynamic and distributed network, which integrates various sources of energy into an efficient and multi-participant grid in order to build a green, clean, and flexible energy network [22, 24]. Energy Internet (often reflects Internet plus energy) is a novel energy network that interconnects the power system components: production. Energy Internet is a concept proposed to harness, control, and manage energy resources effectively, with the help of information and communication technology. It improves a reliability of the system, and provides an increased utilization of energy resources by integrating the smart grid with the. The concept of 'Energy Internet' (EI) has been widely accepted by both academic and industry experts after more than a decade of development. Since it was proposed, EI has been discussed and applied to many technical works in power and energy areas.
