

## Methods for Hybrid Use of Optical Cable Splicing

### Overview

It describes three main splicing methods - de-matable connectors, mechanical splices, and fusion splices. Fusion splicing welds two fibers together using an electric arc and provides the lowest loss. Splicing is typically required during cable installation, maintenance, or network expansion. The goal is to achieve the lowest possible optical loss (signal). After the splice is made, an Optical Time-Domain Reflectometer (OTDR) is the definitive tool used to test the splice quality, pinpointing its exact location and measuring its loss. Employing a Visual Fault Locator (VFL), which projects red laser illumination into optical fibers, can illuminate areas with excessive loss. What is Fiber Optic Splicing and Why is it Needed?
