

## Network modules inside the server rack

### Overview

The most important server rack components are the main frame and mounting rails. Networking and communications equipment is often attached directly to the frame by front brackets. To remove the stress on brackets and the rack itself, there may be rear mounting posts that can be adjusted according to the depth of the equipment. Servers and other hardware. As the name implies, server racks are meant to house servers, including traditional rackmount servers, blade servers, and more. However, they may also contain routers and switches, storage devices, uninterruptible power supplies (UPSs), and many other types of equipment, often organized according to the workload they support. The equipment may be "bladed". Accessories elevate server racks from basic structural units to highly functional data center infrastructure. Here are some common add-ons: 1. Blanking panels to manage airflow by closing up empty spaces. 2. Cable management systems with "fingers" that keep cables organized and neat. 3. Fixed, depth-adjustable and sliding shelves to support equipment. The ECX data center cabinets from Enconnex are trusted by the world's largest technology companies. They are engineered to accommodate all the server rack components, parts, add-ons, and essentials we've covered in this blog. Constructed from solid steel and engineered to make equipment installation simple and efficient. Split rear doors and dual side.
