

Network security equipment baseline includes

Overview

Organizations use security baselines to standardize the configuration of servers, workstations, network devices, and applications. This involves setting specific parameters like password policies, disabling unnecessary services, configuring firewalls, and applying security. This document describes baselining concepts and procedures for highly available networks. It also provides significant detail for baseline and threshold processes and implementation that follow. Microsoft is dedicated to providing its customers with secure operating systems, such as Windows and Windows Server, and secure apps, such as Microsoft 365 apps for enterprise and Microsoft Edge. This variation in understanding can make effective communication and implementation challenging.
