

Optical modules are not as fast as electrical modules

Overview

While optical interconnects have historically dominated bandwidth-distance products beyond 100Gbps. meter barrier and approach 1000Gbps. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Optical modules are essential components in modern communication networks, enabling high-speed data transmission over fiber optic cables. As the demand for faster and more reliable internet and data services grows, understanding these devices becomes increasingly important. According to different rates, encapsulation types and interface types, optical modules can be divided into different categories, one of which is the electrical port module. In daily enterprise network deployment, electrical. Optical module, also known as fiber optic module, is an optical device that can transmit and receive analog signals.
