

PoE Switch Power Calculation

Overview

The calculation is simple: list every PoE device, note its peak power usage, sum those values, and add a safety margin. If the result is, for example, 150W, you need a switch with at least 150W total PoE power. Factoring in future expansion is also wise. This tool checks if your PoE switch can power a given number of devices (e. Note: Typical PoE. PoE (Power over Ethernet) power budget refers to the maximum amount of power that can be delivered over a single Ethernet cable to power PoE-powered devices (PDs) such as IP cameras, VoIP phones, and wireless access points. This tool uses the Ethernet cable specifications Cat5E (24 AWG), Cat6 (23 AWG), and Cat6A (23 AWG). Instantly see total power draw versus available budget, identify overload risks, and plan your network infrastructure — all calculated locally in your browser.
