Overview

Repair procedure: We require the metal beamsplitter mounts (frame). Wood splits are a common occurrence, fundamentally caused by the hygroscopic nature of wood, which means it constantly absorbs and releases moisture from the surrounding air. This fluctuation in moisture content leads to dimensional changes, causing the wood to expand across the grain when. Beamsplitters are optical components used to split incident light at a designated ratio into two separate beams. That is true when an instrument is moved a lot or it is powered off a lot. A powered on FTIR bench (warm inside) will have. How about heading to a scrap metal place to get a 2nd beam to place on top (solves height issue at same time)?

Hard to believe that thin knife could prevent wood from splitting and cause steel beam to bend.
