Overview

An Ethernet switch chip is a dedicated integrated circuit (ASIC) that integrates multi-port packet processing and forwarding functions. As network scales continue to expand and application demands diversify, the performance, functionality, and intelligence level of switch chips have become key factors. The three main areas of level for the IEEE 802.3 media standards are transmission distance, bandwidth capacity (10 Mbps to Tbps), and cable type (coaxial, twisted-pair, and fiber). From its initial use, Ethernet has seen significant progress and is now the standard protocol for IP-based networks. In the Internet of Things (IoT), Ethernet switch chips play a vital role. They are the core components for efficient data exchange and transmission in the network.
