Is the environment the router is in suitably cooled and circulated?

The first item to check is if the rack and data center the router is located in has a cooling or air circulation system failure. The fans in networking equipment like the Cisco 2811 play a crucial role in maintaining proper cooling for the components. Changes in configuration might not directly be. Fiber optic networks are celebrated for their speed and reliability, but even the best systems can encounter problems. When issues like signal loss, slow speeds, or intermittent connectivity arise, systematic troubleshooting is key. I'd run some continuous ping tests to start narrowing things down: Your Router ISP Gateway/Router Major website or DNS (anything that will leave the ISP network. I assume it is because of the SFP+ modul...
