

The function and uses of double-fiber pigtail splicing in leather cables

Overview

The bare end of the pigtail is spliced to the main cable, creating a permanent, low-loss connection. This splicing process helps integrate fibers into panels, switches, and transmission equipment without excessive bending or physical strain. Unlike a patch cord—which has connectors on both ends—the bare fiber end of a pigtail is designed to be permanently spliced (either by fusion or mechanical). They are the bridge between fiber optic cables in the field and the equipment or patch panels that manage them. It is usually suitable for field termination using a mechanical or fusion splicer. Compared with quick termination or epoxy and polish connections placed on the field. The most efficient way to terminate a fiber run is by using a pigtail. Fiber pigtails are commonly used in.
