

# The insert beam splitter is not properly inserted

## Overview

It is easier if you insert one flange of the 55mm ring into the adapter hole, and line the opposite flange up with the wider part of the hole labeled "OPEN". Then rotate the ring slightly to lock it onto the beam splitter. (See Picture 1) I opened IFC file and saved it as a Revit file, then inserted said file into my Architecture revit file, on plan view the pilars look fine, being in "front" of the walls and presenting the correct representation. However, when in sections, the beams dont act the same, being mixed into the walls. The set up is either: Camera lens - beam splitter - camera x2 Or, Beam splitter - (lens + camera) x2 I want to be able to take 2x photos at once, so the light has to go through the beam splitter. Is there any way i could solve this?

Thank you! My Model: My Lens Data: Best answer by David. One of the biggest challenges for modeling such a system is that multiple ray paths cannot be simultaneously traced in Sequential Mode. dsub files are generated in static analysis, but not in harmonic response. ANSYS mechanical : How to read the dimensions which are defined as function of other dimensions in UGNX as parameters in ANSYS?

Hi All, I'm working on Ansys 19. 1 and I've inserted a beam through 'connection' menu with all. Beamsplitters are optical components used to split incident light at a designated ratio into two separate beams.
