

The power supply system of a communication station consists of the following components

Overview

Key components like rectifiers, inverters, and batteries work together to convert and manage power, ensuring compatibility and efficiency for telecom equipment. Telecom power supply systems form the backbone of modern telecommunications. Without them, communication services would falter during power outages or fluctuations. Power factor corrected (PFC) AC/DC power supplies with load sharing and redundancy (N+1) at the front-end feed dense, high efficiency DC/DC modules and point-of-load converters on the back-end. The schematic diagram typically includes information such as the power supply, the master station, the sub-stations, and the wiring connections between these components. It helps to illustrate the flow of signals and power throughout the intercom system, ensuring the proper functioning of. The communication power supply system is composed of three parts: AC power supply system, DC power supply system and grounding system: AC power supply system consists of high-voltage power distribution station, step-down transformer, diesel generator, UPS and low-voltage power distribution panel.
