

What is a secondary power distribution box in an enterprise

Overview

It's a secondary panel that takes power from the MDB and further distributes it to specific areas or zones within a building. Understanding the fundamental distinction between Primary and Secondary distribution in electrical systems is pivotal for designing efficient and reliable electrical distribution systems tailored to specific needs across various domains. A feeder usually begins with a feeder breaker at the distribution substation. Typically, primary distribution does not directly supply power to devices, secondary distribution. From there, it is routed to individual building distribution boxes (secondary distribution boxes), which subsequently supply power to unit-level distribution boxes (tertiary distribution boxes), and finally to household systems.
