

Why is it necessary to test the remaining capacity of the second set of optical cables

Overview

An Optical Power Meter and Laser Light Source will be used to measure power loss on each completed ring or distribution span to verify continuity between fibers (no fibers incorrectly spliced together). When a fiber optic system is successfully tested and determined to meet the customer's specific requirements and relevant industry standards, the system performance and individual links can be said to be "certified" to that relevant specification or standard. If it's a long outside plant cable with intermediate splices, you will. You need to follow fiber testing standards like IEC, TIA, and FOA in 2025 to protect your network. These standards help you avoid legal trouble, reduce insurance risks, and keep your systems reliable. Follow. In one cycle, we found that RSOC drops from 10% to 1% significantly too early and remains at 1% (see figures below). unfortunately this is an issue in our application.
