

Why isn't the beam splitter working

Overview

Beamsplitters are generally effective at reflecting s-polarization but they are not as effective at preventing p-polarization from reflecting. This occurs because when s-polarized light hits the reflecting surface, the electric field is in the same plane as the surface. That and the broad angle of incidence requirement will probably make this near impossible. OR Large and small range. □□ For purchasing, use the RP Photonics Buyer's Guide for beam splitters. It provides an expert-curated supplier directory, buyer-focused technical background information, and structured selection criteria to support professional procurement decisions.
